

## UHE Colíder

Rio de Janeiro, August 15, 2025 — Centrais Elétricas Brasileiras S/A – Eletrobras informs that, on May 30, 2025, Eletrobras completed an asset unbundling operation with Copel, through which it acquired the Colíder Hydroelectric Power Plant, located on the Teles Pires River in the state of Mato Grosso, as disclosed in a material fact released on the same date. The plant represents 0.5% of Eletrobras' total assets and has a capacity of 300 MW. At the time of the transaction's completion, the plant was classified under the "ATTENTION" level of dam safety (among four possible levels: NORMAL, ATTENTION, ALERT, and EMERGENCY, in increasing order of criticality).

Since June 5, 2025, although the plant continues to be temporarily operated by Copel, Eletrobras immediately began work to define its own action plan to raise the dam safety level to "NORMAL." For this activity, Eletrobras relies not only on its Dam Safety team but also on a panel of renowned external experts with recognized expertise.

On June 14, 2025, Eletrobras was informed of the rupture of one of the plant's drainage system components. At the time of this event, Eletrobras also received new information that, during maintenance activities on the drains on February 13, an incident had occurred involving one of them, which remains operational. Of the 70 drains that make up the plant's system, four have been damaged since the acquisition of the asset. The drains are structures that allow water pressure beneath the dam to be properly discharged.

Due to the recurrence of similar events within short time intervals, accompanied by the release of subsurface material in the dam area, the panel of external experts hired by Eletrobras recommended the immediate reduction of the Colíder Plant reservoir level as a means to safeguard its integrity, allow for a more accurate assessment of the situation, and define an action plan to restore the dam to the "NORMAL" safety level.

Following the recommendation of the expert panel and in compliance with its duty of care, Eletrobras instructed Copel, on August 13 and 14, to begin the necessary procedures to reduce the reservoir level of the Colíder Plant. Likewise, as a precaution and in strict observance of applicable legislation, Eletrobras decided to change the dam safety level to "ALERT," a measure that triggers the actions outlined in its Emergency Action Plan. This plan ensures that competent public and private entities, as well as affected communities, receive timely and transparent information about the plant, reinforcing the company's unwavering and top-priority commitment to the safety of people, the environment, and its facilities.

Finally, considering that the reservoir level reduction and the "ALERT" status are preventive safety measures, it is important to clarify that the Colíder Plant operates within the safety standards required by current legislation and under the supervision of the competent authorities.
